**Emerald Creek Falls 21<sup>st</sup> April 2007**

## INTRODUCTION

The attached plant list was compiled from notes taken on a visit to Emerald Creek Falls with the Cairns Branch of the Society for Growing Australian Plants on the 21 April 2007 and 20 May 2018. Names of families and species are as recognized by the Queensland Herbarium in the 2017 Census of Queensland Plants. The list covers all plants observed in the gallery rainforest along the creek adjacent to the car park and the adjacent open forest along the track to the top of the falls.

The gallery forest along the creek contains as dominant species *Melaleuca viminalis*, *Callitris intratropica*, *Melaleuca leucadendra*, *Tristaniopsis exiliiflora*, *Banksia aquilona* and *Bursaria tenuifolia* with the open forest adjacent to the track to the falls mainly dominated by *Eucalyptus leptophleba* and *Eucalyptus granitica*.

Two plant families in particular have been overlooked namely the Fabaceae and the Poaceae. Further visits and collection of specimens for identification would be necessary for these difficult to identify in the field families.

## GEOLOGY

The substrate and outcrops adjacent to the falls are composed of Tinaroo Granite (280-270 million years of age) with the face of the falls composed of a fine grained aplite dyke, which was probably injected around the later stages of the solidification of the Tinaroo Granite.
